Mercury free metal halide lamp

The invention relates to a Hg-free metal halide lamp comprising a substantially cylindrical discharge vessel with a ceramic wall having an internal diameter D_i , an internal length L_i and a wall thickness W_t , and filled with an ionizable filling, wherein two electrodes are present having a mutual distance E_A for maintaining a discharge in the discharge vessel, wherein the filling comprises an inert gas, preferably Xe, and a metal halide.

Many automotive head lighting discharge lamp fillings to date contain mercury (Hg). Since mercury is known to be environmentally very unfriendly, many attempts were made to develop a mercury free metal halide lamp, but no satisfactory results have been obtained. Mercury in these lamps was mainly used to increase the electric field strength, whereby as a consequence the lamp current can be maintained at a low level, and the electronic ballast can therefore be simple and low cost. A suitable and satisfactory replacement for mercury had not yet been found. For general lighting purposes a solution is known where mercury is replaced by Zn or ZnI, but this solution is not suitable for the small automotive lamps, wherein the electrode distance E_A is approximately 3 - 5 mm, and which usually have a power of between 20 and 35 W.

20

The invention aims at a suitable, efficient and reliable mercury free metal halide lamp for automotive headlight purposes.

After extensive development and testing, a combination of measurements has been found giving satisfactory results. According to the invention the internal length L_i of the discharge vessel is smaller than 8 mm, the electrode distance E_A and the internal diameter D_i must comply with the relation $E_A/D_i > 2$, the inert gas pressure P_{Xe} at room temperature should be at least 5 bar, and the wall thickness W_t and the internal diameter D_i must comply with the relation $W_t/D_i > 0.15$. It was found that the function of mercury in the lamp can at least partially be taken over by the high pressure of the inert gas, preferably xenon and an

extremely small vessel diameter. The discharge vessel must be as short as possible to obtain a sufficiently high coldest spot temperature. Hereby a sufficiently high lamp voltage of approximately 40 - 90 V can be obtained. The wall of the vessel must be sufficiently thick in order to prevent overheating of the wall and in order to prevent large temperature gradients 5 inside the wall, which both can cause cracking, creep or even melting of the vessel.

Preferably the length of the cylindrical outer surface of the discharge vessel L_o is at least 8 mm, preferably at least 9 mm, more preferably at least 9.5 mm. Hereby a sufficient heat dissipation of the vessel is achieved.

For luminous efficacy the metal halide preferably comprises at least 40 10 :mol/cm³ of a rare earth iodide, such as NaPrI. Also preferably the metal halide comprises between 20 :mol/cm³ and 140 :mol/cm³ ZnI₂.

Preferably $Li < 7.5$ mm, more preferably $Li < 6.8$ mm, most preferably $Li < 6.2$ 15 mm. Preferably $EA/Di > 3$, more preferably $EA/Di > 4$. In practice EA/Di will usually be smaller than 8, more usually smaller than 6. Preferably $Wt/Di > 0.20$, more preferably $Wt/Di > 0.25$, most preferably $Wt/Di > 0.3$. Preferably $PXe > 10$ bar, more preferably $PXe > 15$ bar. In practice Pxe will usually not be more than 25 bar.

In a preferred embodiment the discharge vessel is surrounded by a transparent 20 substantially cylindrical gas filled outer bulb having its wall at a distance which is less than 1 mm, preferably less than 0.5 mm, for further improving the heat dissipation of, and heat distribution and homogenisation inside the wall of the discharge vessel. Also in a preferred embodiment the discharge vessel is provided with coated areas for increasing the coldest spot 25 temperature.

The above and further aspects of the lamp according to the invention will now 30 be explained by way of an exemplary embodiment and with reference to the drawings (not true to scale), in which:

Fig. 1 diagrammatically shows a lamp according to the invention; and

Fig. 2 shows the discharge vessel of the lamp of Fig. 1 in detail.

30

Fig. 1 shows a metal halide lamp provided with a discharge vessel 3. The discharge vessel 3 is shown in more detail in Fig. 2, with a ceramic wall 31 which encloses a discharge space 11 containing Xe and an ionizable filling. Two electrodes with tips 4a, 5a

having an interspacing EA are arranged in the discharge vessel 3, which has an internal diameter Di at least at the area of the interspacing EA.

The discharge vessel is closed off at either end by a respective ceramic projecting plug 34, 35 which encloses with narrow interspacing a respective current lead-through conductor 40, 50 to the electrode 4, 5 arranged in the discharge vessel. The discharge vessel is surrounded by an outer bulb 1. Part of the ceramic projecting plug 34, 35 and an adjoining portion of the ceramic discharge vessel 3 are provided with an external coating 41, 51. The lamp is further provided with a lamp cap 2. A discharge extends between the electrodes 4 and 5 in the operational state of the lamp. The electrode 4 is connected to a first electrical contact forming part of the lamp cap 2 via a current conductor 8. The electrode 5 is connected to a second electrical contact forming part of the lamp cap 2 via current conductors 9 and 19. The current conductor 19 is surrounded by a ceramic tube 110.

The ionizable filling of the discharge vessel 3 of the lamp comprises 0.6 mg NaPrI and 0.1-0.2 mg ZnI₂. The filling further comprises Xe with a filling pressure at room temperature of 16 bar.

The distance between the electrode tips EA is 5 mm, the internal diameter Di is 1.2 mm, so that the ratio EA/Di=4.17. The wall thickness Wt of the discharge vessel 3 is 0.4 mm. The internal length of the discharge vessel 3 Li is 6.0 mm, the outer length Lo is 10 mm. The total length of the discharge vessel 3 and the plugs 34, 35 is 24.0 mm. The diameter of the current lead-through conductors 40, 50 is 0.54 mm.

Part of the ceramic projecting plug 34, 35 and an adjoining portion of the ceramic discharge vessel 3 are provided with an external coating of Pt. The external coating extends to 0.25 mm from the relevant electrode tip. The outer bulb 1 of the lamp is made of quartz glass. The internal diameter of the outer bulb 1 is 3 mm, its wall thickness is 2 mm. The outer bulb 1 is filled with N₂ with a filling pressure of 1.5 bar at room temperature.

The lamp has a power of 30 W, and a luminance of 78 Mcd/m². The maximum wall temperature is approximately 1700 K. The temperature gradient from the upper middle to the lower middle in a horizontally burning discharge vessel is less than 150 K.

CLAIMS:

1. A Hg-free metal halide lamp comprising a substantially cylindrical discharge vessel with a ceramic wall having an internal diameter D_i , an internal length L_i and a wall thickness W_t , and filled with an ionizable filling, wherein two electrodes are present having a mutual distance E_A for maintaining a discharge in the discharge vessel, wherein the filling comprises an inert gas and a metal halide, wherein the internal length L_i is smaller than 8 mm, wherein the electrode distance E_A and the internal diameter D_i comply with the relation $E_A/D_i > 2$, wherein the inert gas pressure P_{Xe} at room temperature is at least 5 bar, and wherein the wall thickness W_t and the internal diameter D_i comply with the relation $W_t/D_i > 0.15$.

10

2. A lamp according to Claim 1, wherein the length of the cylindrical outer surface of the discharge vessel L_o is at least 8 mm, preferably at least 9 mm.

15

3. A lamp according to Claim 1 or 2, wherein the metal halide comprises at least 40 :mol/cm³ of a rare earth iodide.

4. A lamp according to Claim 1, 2 or 3, wherein the metal halide comprises between 20 :mol/cm³ and 140 :mol/cm³ ZnI₂.

20

5. A lamp according to any one of the previous Claims 1 - 4, wherein $L_i < 7.5$ mm, preferably $L_i < 6.8$ mm, more preferably $L_i < 6.2$ mm.

25

6. A lamp according to any one of the previous Claims 1 - 5, wherein $E_A/D_i > 3$, preferably $E_A/D_i > 4$.

7.

A lamp according to any one of the previous Claims 1 - 6, wherein $P_{Xe} > 10$ bar, preferably $P_{Xe} > 15$ bar.

8. A lamp according to any one of the previous Claims 1 - 7, wherein $Wt/Di > 0.2$, preferably $Wt/Di > 0.25$, more preferably $Wt/Di > 0.3$.

9. A lamp according to any one of the previous Claims 1 - 8, whereint the
5 discharge vessel is surrounded by a transparent substantially cylindrical gas filled outer bulb
having its wall at a distance which is less than 1 mm, preferably less than 0.5 mm.

10. A lamp according to any one of the previous Claims 1 - 9, wherein the
discharge vessel is provided with coated areas for increasing the coldest spot temperature.
